

## ***CTR-02 Upper Receiver with Brass Deflector***

---

***CAUTION: REMOVE MAGAZINE AND VISUALLY CHECK CHAMBER TO MAKE SURE THAT FIREARM IS UNLOADED.***

The JP CTR-02 stripped upper receiver is machined from billet 7075-T6 aluminum and will be compatible with any forged lower receiver with Mil-spec tolerances. You can purchase a matching CTR-02 lower assembly, but any serial numbered items such as the lower must be transferred through your local dealer.

This upper receiver features our unique Integral ACOG Interface, which allows for the direct mounting of any Trijicon TA01 (4x32) series optic in one of three pairs of holes to adjust for eye relief. The result is a lower height-to-bore measurement that many prefer over traditional mounting solutions for ACOGs because it allows for a tighter cheek weld and faster acquisition. The CTR-02 upper will also accept any mount or accessory that is designed to fit a MIL-STD-1913 Picatinny rail. We recommend the JPFTSM scope mounts, which are designed specifically to match the contour of the CTR-02 upper receiver and provide solid, return-to-zero detachability.

Although we recommend the JP/VTAC modular hand guard system, the CTR-02 upper receiver will accommodate most other hand guard solutions. Follow the individual manufacturer's installation instructions. Refer to our website for other matching JP high performance components.

***THANKS FOR YOUR BUSINESS!***
